

## HW 10

Gitub- <https://github.com/Noamtish/Hello-World-NoamTish.git>

Noam Tishkevich 205988413

1.

- I created SQL table users with 3 columns username,password.job and inserted values to the table
- Downloaded the flask file from moodle and added another blueprint called assignment10
- I added a link in main menu to assignment 10
- I created a new html file assignment 10 with 3 forms insert (post) update(post) delete (get)
- In assignmeny10.py I used separate route for each form. In each route I used DBmanger to execute the queries with the inputs inserted in the html after the query excuted I redirected back to the assignment10 url where the updated list is showed
- The table is showed with fetch statement (select username,job from users)
- I added a session[action] in each function with the name of the action was executed
- I added in html if clause that if session.ation exists it will be added in he top of the page
