1.

- I created SQL table users2 with 5 columns userid(int not null),firstname(varchar not null),lastname(varchar not null),hobby(varchar null),pet(varchar not null) and inserted values to the table (user id's 1,3,4,5)
- I added a new blueprint to assignment 10 named HW11
- In HW11 HW11.PY I added new route '*assignment11/users*' and function that excuting select * query from users2 table and returns it as json file with jsonfiy package .
- Before the function there is a if clause that indicates if the request.method is get
- In HW11.py I Create a new route called: '*assignment11/users/selected/<int: USER_ID>* and function that gets the variable indicates the user id ,excuting select query with where clause with the user_id . if the result length is not 0 the it returns the result and indicates success if its 0 then the user_id is not exists
- There is an HW11.route('/assignment11/users/selected' ,defaults ={'user_id':3}) which indicats a default value to the user_id
